

For warming above 2°C,
the average time to lose the
last 1 million km² of Arctic
sea-ice is shorter
for higher emission scenarios

Scenario	Mid-Century Warming (°C)	Duration: Practical to Actual (years) Interquartile Range
SSP 1-1.9	1.6	Never
SSP 1-2.6	1.7	Never
SSP 2-4.5	2.0	21.5-41
SSP 3-7.0	2.1	11.3-26.8
SSP 5-8.5	2.4	7-19

Acknowledgments
Funding from NSF-OPP award 1847398 supported the CURE class that this research was carried out in. This work utilized the Alpine high performance computing resource at the University of Colorado (CU) Boulder, in particular a classroom allocation and Jupyter sessions on Open OnDemand. Alpine is jointly funded by CU Boulder, CU Anschutz, Colorado State University, and NSF award 2201538. Warming estimates from IPCC, 2023: Summary for Policymakers. We acknowledge the WCRP which coordinated CMIP6 and the climate modeling groups that performed the CMIP6 experiments. Daily SIE data are from Heuzé and Jahn 2024.
